

CHAPTER 8.0 GROWTH-INDUCING IMPACTS

8.1 Definition of Growth-Inducing Impacts

Section 15126.2(d) of the California Environmental Quality Act (CEQA) Guidelines requires that an Environmental Impact Report (EIR) describe the potential growth-inducing impacts of a proposed project. Specifically, Section 15126.2(d) states:

"Discuss the ways in which the proposed project could foster economic development or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment.... Also discuss the characteristics of some projects that may encourage and facilitate other activities that could substantially affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental or of little significance to the environment."

Normally to assess whether the proposed project may foster spatial, economic or population growth, several questions are considered:

- Would the proposed single-family residential/equestrian/open space and mixed-use project result in the removal of an impediment to growth such as the establishment of an essential public service or the provision of new access to an area?
- Would the proposed single-family residential/equestrian/open space and mixed-use project result in economic expansion or growth such as changes in the revenue base or employment expansion?
- Would the proposed single-family residential/equestrian/open space and mixed-use project result in the establishment of a precedent setting action such as an innovation, a radical change in zoning or a General Plan amendment approval?
- Would the proposed single-family residential/equestrian/open space and mixed-use project result in development or encroachment in an isolated or adjacent area of open space, as opposed to an infill type of project in an area that is already largely developed?

8.2 Analysis of Growth-Inducing Impacts

Potential project-related growth-inducing impacts related to each of the questions cited above are discussed below.

Would the proposed single-family residential/equestrian/open space and mixed-use project result in the removal of an impediment to growth such as the establishment of an essential public service or the provision of new access to an area?

As indicated previously, the proposed project is located in an area of the City of San Juan Capistrano where all of the essential public services and/or utilities either exist or can be extended to the subject property in accordance with the adopted General Plan long-range plans for the area. Further, the existing public facilities and services, including police, fire protection services, sewer, water, and flood control facilities, and parks and recreational facilities, are adequate to serve the proposed project. Although development is proposed on this vacant property, the proposed use(s) of the site has been anticipated by

the General Plan Land Use Element and the adopted Comprehensive Development Plan for the area. As a result, there would not be any significant unanticipated service or facility demands that would result from project implementation. The increased demands for public services and facilities would not result in the need to expand an existing service or create a new service that would eliminate an existing impediment to growth because the project represents an extension of existing development in the project environs. The resulting growth has been anticipated by virtue of the long-range plans for the area adopted by the City.

Would the proposed single-family residential/equestrian/open space and mixed use project result in economic expansion or growth such as changes in the revenue base or employment expansion?

Implementation of the proposed project will result in the development of the site as permitted by the City's General Plan and Comprehensive Development Plan. The Distrito La Novia/San Juan Meadows development would generate additional local tax revenue from various sources (e.g. property taxes, sales taxes, gas taxes, business license fees, etc.) that would supplement the City's General Fund and may be used to implement improvements that would serve not only the proposed project but also the City as a whole. Further, implementation of the proposed project would also result in the generation of additional employment in the City, consistent with the long-term goals and objectives of both the General Plan and regional plans adopted for the area. The City estimates that the project would directly generate 246 new full-time jobs. Specifically, the City's General Plan seeks to create a "balance" of land uses, including residential, employment, and transportation/circulation, and open space and recreation. While the proposed project does represent an expansion of the City's employment base, the overall expansion would be consistent with the long-range plans adopted by San Juan Capistrano, as indicated above. The City does not anticipate that "new" development or significant expansion of existing commercial development and employment, not already contemplated, would occur as a result of the project because the project represents "infill" development and is located in an area of the City that is currently supported by all necessary public services, facilities, utilities and related infrastructure. Aside from the extension of existing facilities to the subject property that may be required, the project would not serve to induce unanticipated growth.

Would the proposed single-family residential/equestrian/open space and mixed-use project result in the establishment of a precedent setting action such as an innovation, a radical change in zoning or a General Plan amendment approval?

As indicated previously, although a general plan amendment and zone change are proposed by the applicant, and the zone change is necessary to consolidate the two properties into a single Planned Community, the proposed project is generally consistent with the long-range plans adopted for the site, which generally promote commercial development (i.e., a hotel and ancillary uses) on the Distrito La Novia property and residential development on the San Juan Meadows property. The proposed single-family/equestrian/open space and mixed uses are permitted by the existing land use designations and would be implemented through the proposed Planned Community/CDP developed for the property, which will guide future development of the two land use components. The applicant is requesting the approval of several discretionary actions (e.g., general plan amendment, zone change, architectural control, landfill closure plan, development agreement, etc.) by the City Council in order to accommodate the proposed project. However, with the exception of the General Plan Amendment and zone change that would allow for the consolidation of the two properties into a single Planned Community, none of the actions necessary to permit the project as proposed would represent a significant or radical change to the adopted land use and related regulatory controls governing development of the subject property. The Comprehensive Development Plan would establish use and development standards for the proposed residential, commercial, office, retail and equestrian uses and structures. The equestrian standards would need to include provisions for stables, paddocks, hot-walkers, training arenas (covered or un-covered), wash racks, turnouts, pastures, and similar improvements. The intensity of development proposed by the

applicant is within the parameters established by the San Juan Capistrano General Plan and would not exceed either the population or employment projections forecast for the City. In fact, the intensity of residential development proposed for the San Juan Meadows component is substantially less than that allowed under the General Plan Land Use Element, and the amount of open space acreage is more substantial than previously approved.

Would the proposed single-family residential/equestrian/open space and mixed-use project result in development or encroachment in an isolated or adjacent area of open space, as opposed to an infill type of project in an area that is already largely developed?

Generally, growth-inducing projects possess such characteristics as being located in isolated, undeveloped or under-developed areas, necessitating the extension of major infrastructure (e.g., sewer and water facilities, roadways, etc.) or those that could encourage the “premature” or unplanned growth in an area not planned for development (i.e., “leapfrog” development). Although the subject property is located near San Juan Creek and the North Public Lands (Glendale Federal open space), recognized open space features in the City of San Juan Capistrano, the site is located within an urbanized area in the City and will not encroach into these open spaces allocated in the existing long-range plans adopted by the City. As such, it is important to note that the proposed conversion of the undeveloped site to an urban use that will support a variety of residential, commercial, open space and recreation uses will not remove any obstacle to population growth since the project site is located in an area that is urbanized and designated for development. The proposed project encompasses the final phase (i.e., San Juan Meadows) of development associated with the Forster Canyon Planned Community (CDP 81-1) and the adopted Specific Plan/Precise Plan designation (i.e., Distrito La Novia). As indicated above, all essential infrastructure, including sewer and water facilities, storm drainage facilities, electricity and natural gas, and related utilities currently exist, or can be extended to the site without creating the need for unplanned infrastructure expansions. Utility extensions would occur consistent with the City’s adopted facility plans (i.e. Master Plan of Drainage, Sewer Master Plan, Domestic Water Master Plan, Non-Domestic Water Master Plan, Master Plan of Streets & Highways). All of the public services and facilities have adequate capacity to accommodate the proposed expansion; and, project implementation will not result in significant or unanticipated increases in demands on the infrastructure. Therefore, no significant growth-inducing impacts are anticipated

8.3 Conclusion

The Analysis of Growth-Inducing Impacts concludes that based on the four criteria established herein, the proposed Distrito La Novia/San Juan Meadows project would not result in any growth-inducing impacts. The proposed project includes only the development of an existing, undeveloped site that is designated for future development by the long-range plans adopted by the City of San Juan Capistrano. Further, the proposed uses (i.e., single-family residential/equestrian/open space and a mix of commercial and retail development) are not characterized by features that attract or facilitate new, unanticipated development that would ordinarily be considered growth-inducing. Conventionally, growth inducement is measured by the potential of a project or a project’s secondary effects (i.e. provision of new infrastructure which supports housing or creation of jobs) to facilitate development of housing. Further, all of the infrastructure that exists in the project area (or can be readily extended to the project components) can provide an adequate level of service, including sewer, water, and storm drainage. Circulation improvements required as a result of project implementation are forecast in the long-range plans adopted by the city (i.e., Circulation Element of the General Plan). As previously indicated, project implementation will not result in any significant direct or indirect addition of residential development that would generate new residents or employment that would be an “attractor” of residents to the area that are not already anticipated in the General Plan. The site is not located in an isolated area that is constrained by the absence of infrastructure where the provision of infrastructure would promote further development. None of the accepted standards that distinguish growth-

inducing projects characterize the proposed project; therefore, no significant growth-inducing impacts are anticipated as a result of project implementation.
